

AL MARAYA DECOR (AMD) — Internal Operations

PWA

ROLE: Salman is owner of Al Maraya Decor, a Bahrain interior décor/fit-out company, and sole developer of a custom internal PWA replacing legacy Q-Pro ERP. Vanilla JS/HTML/CSS only — no frameworks. Dark shell theme, light Operations theme. Deployed via GitHub Pages (manual upload, not Netlify).

FILES: data.js, shell.js, operations.js, curtain.js, purchasing.js, storekeeper.js, styles.css, index.html. sw.js does not exist yet. index.html is never hand-edited directly by Claude — deliver full replacement files when index.html is in context, or precise copy-paste snippets/instructions when it isn't.

SCRIPT LOAD ORDER (fixed): data.js → shell.js → operations.js → curtain.js → purchasing.js → storekeeper.js

SESSION DISCIPLINE (non-negotiable)

- One major build task per session. Fresh chat per session.
- Audit/read relevant files before proposing anything.
- Confirm approach/architecture FIRST, then write code. Never code before the decision is locked — especially for schema changes or ambiguous UX/architecture calls.
- End every session with a plain-text (not rendered) handoff brief for the next chat: what was built, what's verified, what's NOT verified, exact next steps.
- Proactively tell Salman when it's time to start a new chat — don't wait to be asked.

VERIFICATION BEFORE HANDOFF (every session, every modified file)

1. `node --check` on each modified file, and on the full concatenated load order above (cross-file global const/let collisions only surface this way — single-file checks miss them).
2. Duplicate top-level function/const/let name scan, restricted to true unindented top-level declarations only (indented/function-local names produce false positives — exclude

them).

3. Cross-reference every onclick/onchange/oninput against defined functions.

KEY DOMAIN RULES

- BD cost figures NEVER render in the Curtain UI — hours/quantities only. Operations is the strict cost gatekeeper.
- Purchase Requests never require approval. Every PO and every Invoice does, regardless of origin (direct or converted from PR/PO).
- Every Storekeeper stock release requires a job — no general/no-job release — so every release stays traceable via an itemCard.
- `curtainJobs[].purchaseInquiries[]` and the PR/PO/Invoice chain are permanently separate systems — reconciled only as read-only KPI rollup, never merged.
- Unconfirmed figures (e.g. hardware recipe quantities) must use explicit Confirmed/Unconfirmed/Needs Spec badges — never presented as trustworthy by default.
- CSS injected into `<head>` must use `<style>` tags — raw text injection has broken the shell before.
- New standalone modules can self-create their DOM shell dynamically via JS (`createElement + appendChild`) when `index.html` isn't in context — same pattern as `storekeeper.js` and the Pipeline Board overlay.

PEOPLE

Silva (Curtain & Blinds PM) · Stitch: Waseem, Aslam, Rijwan, Ibrahim · Track: Abdullah, Prince · Install: Shibu, Sohail, Mushraf, Furqan, Shahzad, Saeed · Networksy (external dev, receives handoff snippets) · Salman (owner, approves budgets over BD 5,000)

COMMUNICATION

Salman is terse and direct, works primarily on iPad/iPhone. Explain simply before making architectural calls. Keep responses scannable on a small screen.
